TITLE: Conference of junior research workers, engineers and aspirants of the Institute of the Physics of the Earth, Ac.Sc., U.S.S.R. (Konferentsiya mladshikh nauchnykh sotrudnikov, inzhenerov i aspirantov Instituta Fiziki Zemli AN SSSR).

PERIODICAL: "Izvestiya Akademii Nauk, Seriya Geofizicheskaya"  
(Bulletin of the Ac.Sc., Geophysics Series), 1957, No.3,  
pp.411-415 (U.S.S.R.) .

ABSTRACT: The conference was held on December 24-26, 1956. 21 papers were read relating to work completed in 1955 and 1956.

In this report the contents of the individual papers are briefly summarised.  
V. A. Romanyuk read a paper on determining the force of gravity of the sea; it is stated that other authors did not take into consideration the rotation of the base when formulating the differential equations of the pendulum movements and, therefore, he derived formulae in which this rotation is taken into consideration and which are convenient for practical utilisation.Card 1/4    A. V. Rykov read a paper on measuring the energy flow of seismic waves. He obtained several recordings of the

49-3-15/16

Conference of junior research workers, engineers and aspirants of the Institute of the Physics of the Earth, Ac.Sc., U.S.S.R. (Cont.)

energy of seismic waves and evaluated the energy of earthquakes comparing the results with values calculated by means of a formula which is in use.

V. A. Smirnov discussed his investigations with optical instruments for measuring the seismic inclination proposed by G. A. Gamburtsev.

G. I. Reysner read a paper on "New movement of the Alay depression and the mountains surrounding it".

N. N. Leonov read a paper on the present structure of the Pamir-Alay region and comparison of its structure with the seismicity.

S. V. Vinogradov read a paper on acoustical observations in (coal) mine workings and he concluded that such acoustical observations are of interest from the point of view of investigating physical processes taking place in earthquake foci.

Card 2/4. V. I. Myachkin read the paper "Study of the stress state of a massive under mine working conditions by means of ultrasonics."

49-3-15/16

Conference of junior research workers, engineers and aspirants of the Institute of the Physics of the Earth, Ac.Sc., U.S.S.R. (Cont.)

I. S. Tomashevskaya read the paper "On the problem of investigation of the shear modulus of rock specimens under conditions of high pressures from all sides".

O. I. Silayeva read a paper on investigating the propagation of elastic waves in rods and plates.

The paper of V. S. Isayev was devoted to the study of distortions of the wave pattern in the case of grouping of seismographs (explosions) in seismic prospecting.

S. A. Fedotov read a paper on the kinematic and dynamic features of waves refracted at curvilinear boundaries.

Ye. V. Rybakova read a paper on dipole electromagnetic sounding.

O. M. Barsukov read the paper "Certain problems of the method of measurement in an elliptical polarised electromagnetic field".

B. P. D'yakonov read the paper "Diffraction of electromagnetic waves on spherical inclusions in a two-layer medium".

I. I. Rokityanskiy read a paper on the study of the induced polarization in ion conducting rocks.

A. S. Bol'shakov read the paper "Magnetic stability of rocks".

R. S. Taychinov read the paper "Magnetic properties of sedimentary rocks in strong magnetic fields".

Card 3/4

49-3-15/16

Conference of junior research workers, engineers and aspirants of the Institute of the Physics of the Earth, Ac.Sc., U.S.S.R. (Cont.)

S. P. Burlatskaya read a paper on the technique of measuring the magnetic properties of rocks.

S. Yu. Brodskaya read a paper on investigating the magnetic properties of anisotropic rocks.

Ye. N. Mokhova read the paper "Magnetization of a rectangular prism".

N. F. Mal'tseva and K. Ya. Koz'yakova read a paper on the technique of evaluation of recordings of micro-variations of the magnetic field of the Earth.

AUTHOR: Leonov, N. N.

TITLE: The Ulugchat Earthquake in 1955

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geofizicheskaya  
1959, Nr 11, pp 1708-1713 (USSR)

ABSTRACT: The earthquake occurred on April 15, 1955, with three tremors at 0340, 0412 and 0414 GMT. The analysis of data is presented in Figs 1 to 3. Fig 1 shows the affected zone where a, b, B, 1, 2, e, u, are the areas of earthquakes with the force 6 - 7, 6, 5 - 6, 5, 4 - 5, 4, and 3 - 4 respectively, 1 - epicentre ( $H = 50 \pm 10$  km), u - isolines, k - character of focus dislocations. Fig 2 gives the nomogram for determination of the focus ( $h$ , km) from the isolines ( $\Delta$ , km). The tectonic structure of the area is given in Fig 3 where 1, 2 - Mesozoic depressions; 3, 4 - Alpine regions; 5 to 8 - elevations; 9 - deep faults; 10 - large scale faults; 11 - the epicentre. There are 3 figures and 11 Soviet references.

Примечание: This publication is intended for scholars.

Содержание: The publication contains articles based on research results obtained by members of the Council on Geology of the USSR and the Institute of Geological Sciences of the USSR. The articles report the results of work done over the last 10 years. The articles reflect the problems of regionalization, the distribution of geological structures, the distribution and division of the geological environment, the distribution of geological structures, the distribution and division of the geological environment, and the distribution and division of geological structures. The articles are essentially by themselves, and their scientific value is determined by the quality of the data presented.

TITLE: Experimental close seismic zoning - a region of Western Turkmenistan serving as an example

SOURCE: Akademiya nauk SSSR. Sovet po seismologii. Byulleten', no. 8, Moscow, 1960. Voprosy seismicheskogo rayonirovaniya, 131-141

TEXT: The article deals with an attempt at close seismic zoning carried out by the Aralo-Kaspiyskaya ekspeditsiya Geofizicheskogo instituta (Aral-Caspian Expedition of the Geophysics Institute) which, in connection with planned hydrotechnical construction, had to compile a 1:200,000 scale map of seismic zoning for the territory of the Kopet-Dag mountain range and adjacent regions. For the compilation of this medium-scale map, a number of generalized geological materials were selected and geophysical data was required. The geological engineering, and geophysical data was required. The geological geologic, B.A. Petrushevskiy, A.T. Donabedov, A.Z. Kats, I.P. Kosminskaya, N.N. Andreyev, Ye.I. Gal'perin, ✓

Leonov, S.I. Masarskiy, S.V. Medvedev, B.A. Petrushevskiy, S.V. Puchkov, V.A. Rastvorova, I.A. Rezanov, Ye.F. Savarenkiy, and D.A. Kharin participated in the selection of geophysical data, editorial work, and the final compilation of the map. The leader of the expedition G.A. Gamburtsev acted as editor and the work was completed in 1953. The original report, on which this article is based, was published by B.A. Petrushevskiy and the authors (Ref. 16: Geologicheskoye obosnovaniye karty seismicheskogo rayonirovaniya masshtaba 1:200,000 [Geological basis of a 1:200,000 scale map of seismic zoning]. Bib-ka In-ta fiziki Zemli, 1953). The authors describe the geological development of the region and dislocations due to faults, classifying the latter into several groups. A comparison between the distinguished tectonic zones and present seismicity showed that most earthquakes gravitate towards zones of recent tectonic movements. The proposed map of seismic zoning is considered as a more accurate and detailed parallel to a seismic sketch map. The special features of the proposed map are as follows: (1) The isolines of seismic intensity are given as 4-5 km wide zones. (2) Zones, the seismicity of which has recently increased, are distinguished. (3) Zones of possible secondary earthquake phenomena (landslides, etc.) are marked. (4) Zones of

Card 2/3

Experimental close seismic ...

S/519/60/000/008/016/031  
D051/D113

average, favorable and unfavorable ground conditions for construction are distinguished. Although aware of the map's shortcomings, the authors regard it as essential for the planning of large industrial regions and hydrotechnical construction. However, in the selection of individual building sites, more detailed maps of seismic microzoning would be required. There are 2 figures and 19 Soviet references.

TITLE: A device for fastening an element inside a shell in a gas stream. Class 47.  
No. 179143 14 76

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 4, 1966, 124

TOPIC TAGS: gas flow, aerodynamic drag

ABSTRACT: This Author's Certificate introduces a device containing braces for fastening an element inside a shell in a gas stream. Hydraulic drag is reduced and the reliability of the fastening is improved by installing the braces at an angle to the axis of the shell and by using ball-and-socket hinges for fastening the braces to the inside surface of the shell and to the element.

AUTHOR: Leonov, N. N.

ORG: Institute of Physics of the Earth, Academy of Sciences, SSSR (Institut fiziki Zemli Akademii nauk SSSR)

TITLE: The part played by geologic structure in permanent soil deformation during earthquakes ✓

SOURCE: AN SSSR. Institut fiziki Zemli. Trudy, no. 36 (203), 1965. Seysmicheskoye mikrorayonirovaniye; voprosy inzhenernoy seismologii (Seismic microdistricting; problems of engineering seismology), no. 10, 132-136

TOPIC TAGS: seismology, earthquake, soil mechanics, tectonics, geomorphology ✓

ABSTRACT: The author considers the relationship between propagation and magnitude of permanent deformations, geologic structure and tectonics of the earthquake region with regard to their application in microseismic zoning. A detailed study of various types of deformations which take place during earthquakes and a comparison of these deformations with the geologic structure of the region shows that permanent

Card 1/2

L 24454-66

ACC NR: AT6007204

O

deformations usually take place in sections where there is a frequent change in the lithological composition. The strike of the permanent deformations may be determined from lithological boundaries, tectonic contacts and faults. Maximum deformations in the edge region adjacent to the epicenter take place in the zone of deep fractures. The conclusions of this paper are made without taking account of the geomorphology of inclines and valleys, water content and similar considerations. Factors such as steep banks, woodland and water content may have a strong effect on the pattern. The conclusions drawn in the paper should be taken into account in seismic zoning and particularly during microseismic zoning for civil engineering purposes. Orig. art. has: 2 figures.

engines, automobiles, tractors, marine engines and locomotives.

Card 1/11

Internal Combustion Engines. v.1: Working Processes (Cont.) 326

COVERAGE: The authors give a brief historical survey of internal combustion engine development in the USSR and mentions the names of the principal designers and engine types built from 1901 to the present. Theoretical bases of contemporary engine cycles, combustion, intake, supercharging processes, fuel supply and engine control are discussed. The influences of the operational and design factors on the work of the engine are analyzed. Problems of power, efficiency, carburetion, transportation engine characteristics, and the bases of mixture formation in compression ignition engines and gas engines are discussed.

This book is a revised and enlarged edition of Dvigateli vnutrennego sgoraniya (Internal Combustion engines) Vol. I (Mashgiz, 1951). Particularly extensive revisions were made on Chapters III, V and IX. Chapters IV and VII have been rewritten. Chapters I and VII were written by Orlin, A.S.; Chapters II and IV by Vyrubov, D.N.; Chapter III by Vyrubov, D.N. and Leonov, O.B.; Chapter V by Vyrubov, D.N. (Sections 1-7),

Dvigateli vnutrennego sgoraniya; opisatel'nyy kurs (Internal Combustion  
Engines; Descriptive Course) Moscow, Mashgiz, 1960. 451 p. 15,000  
copies printed.

Ed. (Title page): A. S. Orlin, Professor; Ed. (Inside book):  
L. I. Yegorkina; Managing Ed. for Literature on Automotive, Tractor, and  
Agricultural Machine Building: I. M. Bauman, Engineer; Tech. Eds.:  
B. I. Model' and T. F. Sokolova.

PURPOSE: This textbook is intended for students at machine-building schools  
of higher education, and for personnel engaged in the production and  
operation of internal-combustion engines.

COVERAGE: The book describes the construction and operation of all the main  
types of reciprocating internal-combustion engines, and of individual

TITLE: A combination system for control of a marine engine

SOURCE: IVUZ. Mashinostroyeniye, no. 11, 1966, 92-96

TOPIC TAGS: marine engineering, diesel engine, engine control system, hydraulic equipment, marine engine, hydrofoil

ABSTRACT: A combination control system is proposed for optimum acceleration of a marine diesel engine. The system includes two independent regulators (see Figure 1): an acceleration regulator for acceleration of the ship according to selected characteristics, and a static velocity regulator which fulfills the function of a remote control system and maintains a predetermined velocity. The interaction of the separate elements in the control system is illustrated in Figure 2. The acceleration regulator and static velocity regulator have a single common velocity gauge 1 and a common pressure transducer 2 which is a hydraulic power amplifier. The pressure transducer consists of a housing and a diaphragm 3 which controls the transfer cross section of overflow tube 4. The pressure of the velocity thrust against diaphragm 3 tends to restrict the rate at which oil runs into the overflow from the system through discharge nozzle 5 and thus balances the pressure in the overflow cavity of the transducer against the pressure of the velocity head. The design of the transducers for the con-

trol point adjustments of acceleration regulator 6 and static velocity regulator 7 is similar to that of pressure transducer 2, the pressure created by these transducers being proportional to the displacements of control point adjustments 8 and 9. The motor control wheel 10 is acted upon by pressure equal to the velocity head and by pressure from the control point adjustment for static velocity 8. Thus if the velocity falls below the predetermined value, the engine control wheel automatically moves to increase engine power. The servomotor of acceleration regulator 11 limits the motion of the engine control wheel to a value which gives the proper optimum acceleration conditions. As velocity increases, limiter 13 in the acceleration regulator moves to increase engine power so that the motion of the engine control wheel conforms to velocity conditions. An alteration in acceleration conditions (acceleration time and excess engine power) is achieved by changing the pressure in the cavity of servomotor 11 produced by the control point adjustment for the acceleration regulator 9. Thus when the necessity arises for changing velocity, the control point adjustment of the acceleration regulator is set for the required acceleration conditions and the velocity control adjustment is set for the final velocity. Servomotor 12 of the static velocity regulator then brings the engine control wheel against the limiter 13 of the acceleration regulator. The article was presented for publication by Doctor of technical sciences A. S. Orlin, Professor at the Moscow Technical College im. N. E. Bauman. Orig. art. has: 4 figures.

TITLE: Certain results of an investigation of a pulsed argon laser 25

SOURCE: Optika i spektroskopiya, v. 21, no. 2, 1966, 243-244

TOPIC TAGS: gas laser, argon laser

ABSTRACT: Pulsed generation of an argon laser was investigated experimentally. The experimental setup consisted of an external, almost confocal system of spherical interference mirrors and glass tubes ~1.8 m long and 5.7 and 10 mm in diameter with Brewster angle windows and a heater cathode. Current pulses through the tubes were generated by the discharge of a condenser fed by a rectifier up to 10--50 kv. In the  $10^{-1} - 7 \times 10^{-3}$  mm Hg pressure range generation of Ar II occurred in the blue-green spectral region at eight lines: 4097, 4631, 4765, 4880, 4965, 5145, 5610, and 5620 Å. Generation at 5610 and 5620 Å was observed for the first time and occurred at pressures from  $2 \times 10^{-2}$  to  $8 \times 10^{-3}$  mm Hg and voltages of 30 kv and up. The temporal dependence of current pulses and generation on the gas pressure, laser discharge tube diameter, and capacitance was investigated and discussed in detail. Orig. art. has: 1 figure. [YK]

Flax During the Ripening Period.

Orig Pub : Lyen i konoplyu, 1957, No 6, 41-43

Abstract : In experiments conducted by the Experimental Station for  
Flax Moscow in 1954/6, various chemicals were tested (caus-  
tic soda, superphosphate, calcium cyanamide, 2,4-D and  
others), which chemicals proved not to affect adversely the  
crop and the quality of the seeds but precipitated the  
drying of flax bolls during their ripening period. Control  
plants were sprinkled with pure water. Chaff crop was not  
depleted by the treatment, but overall output of long and

TITLE: Elimination of Harmful Effects of Flotation Reagents  
on Concentrate Cyaniding (Ustraneniye vrednogo deystviya  
flotoreagentov pri tsianirovanií kontsentrata)

PERIODICAL: Izvestiya Vysshikh Uchebnykh Zavedeniy, Tsvetnaya  
Metallurgiya, 1958, Nr 4, pp 122-123 (USSR)

ABSTRACT: It has been known for some time that slowing down of  
the reaction observed sometimes in cyaniding flotation  
concentrates is not caused by a film of collector  
adhering to the surface of the gold grains but is due  
to froth formation. The present Authors studied this  
effect in the particular case of gold-rich  
concentrates from Taseyev deposits containing 49.7% SiO<sub>2</sub>,  
4.18% Al<sub>2</sub>O<sub>3</sub>, 1.32% CaO, 17.63% S, 16.8% Fe, 1.1% As,  
0.73% Sb, 0.13% Cu and 0.1% Zn. The first series of  
experiments consisted of cyaniding concentrate taken  
straight from the filter-press and the same .

Elimination of Harmful Effects of Flotation Reagents on  
Concentrate Cyaniding

concentrate washed three times with water and dried at 150°C. The ratio of the 0.1% NaCN solution containing barium peroxide as the oxidising agent to the concentrate was 2 to 1 and the experiments, carried out in bottles attached to a mechanical mixer, lasted 24 hrs. The values of gold recovery from the washed and untreated concentrate were 88 and 72% respectively. In the next series of experiments the liquor:solid ratio was increased to 3.5:1. Consequently, less froth was formed and under these conditions 95% gold was recovered from both untreated and washed concentrates. Since air bubbles may be broken up and the flotation reagents washed away when water is removed from the concentrate in the filter press, concentrate removed straight from the flotation machine was used in the next series of experiments in which stationary cyaniding vessels were employed. Here again the same gold recovery of 88% was obtained from both washed and untreated samples. However, when
